

Digital Art

- General term, of artistic works / practices. Use digital technology as an essential part of presentation process.
- The impact of DT has transformed activities (paintings, drawing, sculpture, net art, digital installation art, and VR) recognized artistic practices.
- Can be purely computer-generated or taken from other sources (scanned photograph / image drawn using vector graphics)
- Said to be art of contemporary

Digital arts created

- Using various digital tools and technologies as the main construction of the presentation more than traditional mediums.

Example:

1. Pixelmator
2. Firework
3. Gimp
4. Photoshop

Form of Digital Visual Arts

1. Digital Photography
- Artist uses a digital or conventional camera. The photographs are digitized and translated to the computer environment. Artist uses image editing and special effects software to perform darkroom type manipulation.

2. Photopainting

- Combines the disciplines of photography and painting. Artist uses image editing and paint software to go beyond dark room techniques to add further expression to the image.

3. Digital collage

- Technique combining many images from varying sources into one image. Most achieved by the use of layering techniques in image editing and paint software.

TYPES OF DIGITAL ARTS

1. Fractal art – fractal objects to get still images and media.
2. Data-moshing – removes key-frames between two videos, allowing pixel run together.
3. Dynamic painting – form of digital art, paintings are constantly being updated and changed.

Fractal Art

- Algorithmic art created by calculating fractal objects and representing the calculation results as still images, animations, and media.

Algorithmic / Fractals

- Produced exclusively by mathematical manipulations. This is the so-called “computer generated” art. The art here lies in the invention of the mathematical formulas

themselves and the way the programs are written to take advantage of the display capabilities of the hardware. The art also lies in creative intentions and subsequent selections of the artist/mathematician.

Data-Moshing

- It's a technique used to compress two videos together, removing keyframes from a file so the videos' pixels "bleed" into one another.

Dynamic Painting

- An art that has been generated algorithmically by a computer system. There have been many attempts at producing generative art; the history of it goes back to the early days of computer development.

2D Digital Painting

- The artist creates 2D images totally in the computer virtual environment with the use of painting tools that emulate natural media styles.
- Sometimes Natural Media.

2D Computer Graphics

- Computer-based generation of digital images-mostly from 2D models (geometric models, text, and digital images) by techniques specific to them.

3D digital painting

- Artist uses 3D modeling and rendering software to essentially sculpt in virtual space.

3D computer Graphics

- Graphics that use 3D representations of geometric data (Cartesian) that is stored in the computer for the purposes of performing calculations and rendering 2D images.

BASIC PHASES OF 3D

1. 3D modeling – process of forming a computer model of an object's shape.
2. Layout and animation – the motion and placement of objects within a scene.
3. 3D rendering – computer calculations that, based on light placement, surface types and other qualities, generate the image.

VECTOR DRAWING

- Artist use vector drawing software and creates the image totally in the virtual environment. This makes use of shapes which are outlined and can be filled with various colors and patterns. This tends to produce harder edged or graphic look.

Integrated Art

- This is the "mixed media" of digital ART WORLD.

- Artist combine any number of the techniques to achieve unique results. The digital environment is much less restricted than conventional mediums in this type of integration and manipulation.

Pixel Art

- Consist of digital art in which the image is created at the pixel level. Uses faster graphics software and it is certainly one of the first ever developed types of digital art. People are very likely to have enjoyed some sort of pixel art even though they might be unaware of it.
- Most of computer and video games were based on pixel art.
- Form of digital art created through the use of raster graphics software, where images are edited on the pixel level.

HISTORY OF CINEMA

Inventors

- Early film is a result of inventors, no artists.

Persistence of Vision

Toy Makers

Zoetrope

- Circular drum with slits
- Allow moments of darkness
- Creates illusion of movement
- 1834 by William Horner

Photography

1816

- Nicephore.
- Niepce made first photographic images

1839

- Louis Daguerre
- Created clear, sharp images on silver copperplate.
- 15 minutes exposure time

1841

- 3 minutes exposure

Eadweard Muybridge

1872

- Set up 12 cameras along a track, tied strings to the shutters which were tripped as the horse ran down the track.
- Create movement with photography

Etienne-Jules Marey

1882

- Photographic Gun
- Lens in the muzzle paper in chamber
- Pull trigger and have 12 rapid exposures
- Eventually 100 exposures

George Eastman

1884

- Developed celluloid film
- Created for the still camera, made motion pictures possible
- Flexible and allows light to pass through.

Fred Ott's Sneeze

1889

- William Dickson working for Thomas Edison begins using celluloid film
- First film in America

MOTION PICTURE PHOTOGRAPHY SOLVED

Kinetoscope

OCTOBER 1889

- Dickson shows Edison projection with sound
- Quality is poor
- Edison opts for silent, indiv. Showing of films
- Invented kinetoscope
- Setup in parlors
- Would see dancing, juggling, clowning, wonders of the world
- No stories yet.

BLACK MARIA

- Camera could only move forward and backward
- Roof opened to allow sunlight in
- Building rotated to catch sun's rays
- Camera used electricity

Magic Lantern

1646

- Father athanasius Kircher made drawings of box that could reproduce an image through lens
- Ancestors of present day slide projector.

18th century

- Showmen travel across Europe showing magic lantern shows.
- Used drawn images in the beginning
- Eventually used photographs

19th Century

- Photo plays drew viewers to a story just as film does today
- Combination of magic lantern shows, live actors, and photography
- Some lasted up to 2 hours and told melodramatic stories
- Proved the potential of projected film.

PROJECTION PROBLEMS

- Projector needs a powerful light source to make images clear.
- Film has to run smoothly past this light source without tearing.

Lumiere Brothers

1894

- Tinker with Edison's kinetoscope
- Designed their own machine within a year.

Cinematographe

- Machine shot the pictures, printed them and projected them
- The camera was portable
- Hand crank provided the power.

December 28, 1895

- First theater opens to the paying public
- Basement of Paris Café.

LUMIERE'S SHOW:

1. Workers leaving the lumiere factory
2. Arrival at Lyon
3. A Baby's Meal

HISTORY OF HOLLYWOOD

Early Years

17th to 18th : Lantern Slides

19th : saw vast proliferation of visual forms of popular culture

Industrial Era

- Book of photographs, illustrated fiction.

Early Years

- Middle/working class:
- Visit circuses, amusement parks, music halls, theater troupes, dioramas, stereoscopes

Diorama

- Painted backdrops featuring 3-D. depicting historical events.

Stereoscopes

- Hand-held viewers that created 3D effects using oblong card with two paragraphs printed side by side.

Pre-conditions for Motion Pictures

1st : Scientists realized human eye will perceive motion if a series of slightly different images is placed before it in rapid succession minimally around 16 per second.

Phenakistoscope (1832)

- Deceiving Scope

Zoetrope (1833)

- Life + Turn (daddy long legs)

Pre-conditions for Motion Pictures

2nd: fast-moving images needed to be projected on a surface

17th: Magic Lanterns, projecting glass lantern slides, but couldn't flash large numbers of images fast enough to create illusion of motion.

Pre-conditions for Motion Pictures

3rd: ability to use photography to make successive pictures on a clear surface.

- Speedup exposure time

Exposure

- Presenting rays of light to a photosensitive surface
- First photograph/frame had exposure time of 8 hrs (1839)
- Motion pictures = split-second exposure
- This became feasible in 1878

Pre-conditions for Motion Pictures

4th: photographs needed to be printed on a base flexible enough to be passed through a camera

188: George Eastman devised a camera that made photographs on rolls of thin paper.
KODAK

Next year, he introduced transparent roll of film creating breakthrough in the move toward cinema.

Pre-conditions of Motion Picture

5th: needed to find suitable mechanism for cameras and projectors

- The camera: the film strip had to stop briefly while light entered through the lens and exposed each frame; a shutter then covered the film as another frame moved into place.

Shutter

- Mechanical device for opening and closing the aperture of camera lens to expose film or the like.

Aperture

- opening, usually circular, that limits the quantity of light that can enter an optical instrument.

Major Pre-cursors of Motion Picture

- Eadward Muybridge (1878) and the running horses
- Photographer
- Row of 12 cameras, each making an exposure in one-thousandth of a Second.
- Lantern to project the images which were eventually drawings copied from the photographs onto a revolving disk

Invention of the Motion Picture

- Thomas Edison developed Kinetoscope in 1891 the first motion picture system (peep show in a box)
- Scottish-English immigrant William Dixon joined Edison's team to help develop the technology that would combine pictures and sound

- Looped in :30 vignettes, no story connecting them

Kinetoscope

- A phonograph inside the cabinet. The viewer would look into the peep-holes of the Kinetoscope to watch the motion picture while listening to the accompanying phonograph through two rubber ear tubes connected to the machine. The picture and sound were made somewhat synchronous by connecting the two with a belt
- 46 frames per second

Kinetoscope

The Bioscop

- Invented by Skladanowsky brothers
- Held two strips of 3 ½" film running side by side frames projected alternately
- 15 minute programs
- Too cumbersome

The Bioscop

The Lumiere Brothers

- Invented a projection system that helped make cinema a commercially viable enterprise internationally!
- Designed the "cinematographe"
- 35 mm film
- 16 frames per second

Lumiere Brothers

- Workers Leaving the Factory 1895

American Developments

- Edison's Kinetoscope evolved into Vitascope (life scope) October 1895
- Rough Sea at Dover
- Inventor, Thomas Armat created Vitascope and Edison manufactured it.
- 1894: American Mutoscope Company
- 70 mm film that yielded larger, sharper images

American Developments

- 1897: 2 means of film exhibition
- Peep show devices for individual viewing
- Projection systems for audiences

Types of cinema:

Scenics, topical and fiction films

Scenics

- Short travelogues offering views of distant lands

Topicals

- News events, recreations of key occurrences in studio
- Sinking of battleship Maine during Spanish-American War (1898)

Fiction Films

- Brief staged scenes telling a story
- Some shot outdoors, but most shot in front of painted backdrops
- 1904-became the industry's main product

- Camera set up in one position and action unfolded in one continuous take.
- No credits, music
- Provided live
- by the "exhibitor"

American Developments

- 1905- Admission to Nickelodeon (movie theater) = \$.05-\$.10 for a 15-60 minute production
- Audiences sat on benches, wooden seats
- Front display=hand painted signs
- Actors stood behind screen and spoke dialogue in synchronization with the action on the screen
- Sound effects were made with noisemakers behind the screen
- Warner Bros., Universal, Paramount, MGM got there start as Nickelodeon exhibitors

American Cinema: Pre WWI

- Industry professionals focused on swiftly expanding the demand for film in America
- Nickelodeon theaters were clustered in business districts and working-class neighborhoods
- 1908 Nickelodeons were the main form of exhibition
- Most films came from abroad
- Studio System born from the Nickelodeon boom

American Cinema: Pre-WWI

- Edison company vs. American Mutoscope and Biograph
- Conflicts over camera patents and equipment licensing distracted the two companies from the distribution aspect.
- Two companies decided to cooperate-created Motion Pictures Patent Company that owned and charged licensing fees on key existing patents.
- Production companies had to pay MPPC licensing fees in order to exist

Patent

- An invention or process protected by this right
- The Vitascope

American Cinema: Pre-WWI

- MPPC limited number of foreign companies
- MPPC's goal was to control all three aspects of the industry: production, distribution and exhibition.
- Only licensed companies could produce, distribute and exhibit films=oligopoly
- Eastman Kodak only sold films to MPPC licensed companies, etc.

Production

- The whole creative process involved in the making of a film (shooting footage, set design, costume, directing, editing, etc)

Distribution

- The process of selling and marketing the filmExhibition
- The process of showing the film in theaters
- Exhibitors were those who owned and operated theaters and were involved in the buying/renting process of films.

Oligopoly

- When a small number of firms cooperate to control the market.
- In the film industry, when any other unlicensed firm attempted to shoot, distribute, or exhibit a film, MPPC would threatened to sue for patent infringement.
- Monopoly: when one firm controls the market

American Cinema: Pre-WWI

- The independents fought back!!
- 6000 theaters agreed to pay the fees to MPPC
- 2000 refused
- A market for unlicensed producers and distributors was created by these 2000
- This portion of the industry was identified as the independents.

Theater& Drama

Theater

- Art of impersonating or embodying invitations of performers in a stage with an audience;
- Interpret or relay the story with an audience;
- Performance needs space as acting area, and is performed in time like music;
- Combines arts
- Is an entertainment

Spanish Influence

- KOMEDYA
- SINAKULO
- SARSWELA
- DRAMA

Anglo-American Influence

- Bodabil

Other examples

- SINAKULO
- MORO-MORO
- COMEDIA
- SARSWELA
- DUPLO AT KARAGATAN
- SANGHIYANG
- SUBLI
- TURUMBA AND PASYON
- THREE KING'S PAGEANT
- MORIONES FESTIVAL
- PANUNULUYAN

ELEMENTS OF THEATER

- Playwright
- Performers
- Directors
- Production design
- Theater space

FORMS OF THEATER SPACE

- Proscenium/Picture frame stage
- Thrust or trestle stage □ Booth stage
- Arena stage or theater-in-the-round
- Created or found stage

DRAMA

- Utilize plot and character;
- Develops a theme;
- Arouses emotion or appeals to humor
- Either escapist or interpretative
- Normally presents its action through actors, on stage, and before an audience

ELEMENTS OF DRAMA

- PLOT
- CHARACTER
- THOUGHT
- LANGUAGE
- THEME
- DENOUEMENT
- MUSIC AND SPECTACLE
- COSTUMES AND MAKE-UP
- SCENERY AND LIGHTING

PHILIPPINE DRAMA

TELESERYE/TELENOVELA

DAYTIME

- Gulong ng Palad
- Flor de Luna
- Mara Clara
- Annaliza
- Aguila
- Valiente

PRIMETIME

- Marimar
- Mulasa Puso
- Saan ka man Naroroon
- Pangako Sayo
- Kaytagal kang Hinintay
- Marina
- Mulawin
- Encantadia

Traditional vs. Modern Philippine Drama Structures:

- Storyline
- Twists
- Villains
- Ending
- Examples:
 - Bakekang
 - Bituing Walang Ningning
 - Pangarap na Bituin
 - Crazy for You
 - Maria Flordeluna
 - Maging Sino Ka Man
 - Maging Sino Ka Man: Ang Pagbabalik

Additional GENRE:

1. SUSPENSERYE ex. Patayin sa Sindak si Barbara
2. MUSICASERYE ex. Bituin Kaputol ngl sang Awit Pangarap na Bituin
3. Adventureserye ex. Adventures of Pedro Penduko Asian Treasures
4. Actionserye ex. Bastat Kasama Kita Palos Asero Totoy Bato
5. Comedieserye ex. My Girl Full House

New Face of Drama

- Marimar
- Akosi Kim Samsoon
- Full House
- My Girl
- Betty La Fea
- La Lola
- Sana Maulit Muli
- Muli
- A Time for Us
- Bakekang
- Boys next Door

Photography

The Dual Nature of Photography: Art and Technology

- Photography combines creative expression with technological innovation, capturing moments while advancing through scientific discoveries and digital advancements.

Key Milestones

- a. Camera Obscura
 - Early optical device projecting images on surfaces.
- b. Daguerreotype
 - First successful photographic process using metal plates
- c. Film Photography
 - The shift to flexible film for capturing images.
- d. Digital Photography
 - Introduction of electronic sensors replacing traditional film.
- e. Image Processing
 - Techniques for enhancing and manipulating digital images.

Photography's Influence

The evolution of photography has been deeply intertwined with advancements in optics, chemistry, and digital imaging.

As each new technology emerged, it enabled photographers to capture and express reality more creatively, leading to profound changes in both the art form and its societal impact.

This progression has not only transformed visual communication but has also shaped society's perception of truth and authenticity in imagery, making photography a crucial tool in today's digital landscape

Types of Photography

- a. Portrait
 - Captures emotions and personality through subject focus.
- b. Landscape
 - Showcases the beauty of nature and environmental scenes.
- c. Documentary
 - Tells stories and captures real-life moments authentically.
- d. Macro
 - Highlights intricate details of small subjects and objects.

Types of Photography Genres

- a. Astrophotography
 - Captures celestial events and night skies beautifully.
- b. Architectural
 - Showcases the design and structure of buildings.
- c. Street
 - Documents the energy and life of urban environments.
- d. Wildlife
 - Highlights the beauty of animals in their habitats.

Exploring Diverse Photography Genres

- a. Digital Art
 - Combines photography with creative digital manipulation.
- b. Computational
 - Enhances images using advanced algorithms and software.
- c. VR Photography
 - Immerses photographers in interactive virtual environments.
- d. AR Photography
 - Blends real-world scenes with digital enhancements.

Pioneers and Innovators in Photography

Traditional Photography Elements Explained

Key components in traditional photography include:

1. Exposure : Combination of aperture, shutter speed, and ISO to control light.
2. Focus : Clarity achieved through lens adjustments.
3. Composition : Arrangement of elements within the frame to enhance visual storytelling.

Understanding these elements is crucial for creating impactful images that convey the intended message and aesthetic.

Digital Photography Elements Unpacked

Essential aspects of digital photography encompass:

1. Image Sensors : Capture light and convert it into digital data.
2. Resolution : Determines the clarity and detail of images.
3. File Formats : Various types like RAW and JPEG impact quality and editing flexibility.

Mastery of these digital components enables photographers to manipulate and enhance their images effectively

Artistic Considerations

- In photography, lighting is crucial for setting mood and tone, as it influences how textures and colors are perceived. Understanding color theory enables photographers to create harmonious compositions that evoke emotions.
- The use of texture adds depth and interest, enhancing visual storytelling.
- Additionally, perspective plays a significant role in framing subjects, guiding viewer attention, and establishing context. Mastering these artistic elements is essential for capturing compelling images.

Emerging Trends

- The field of photography is rapidly evolving with innovative technologies. Computational photography enhances images through software-driven processes, allowing for greater detail and manipulation.
- AI is increasingly used for image enhancement, providing tools for automatic adjustments and improvements.
- Additionally, smartphone cameras are advancing with features like multi lens systems and advanced editing capabilities.

- Virtual and augmented reality applications are also transforming the way we experience and interact with photographic content, opening new creative possibilities.

Ethical Considerations

- As digital photography evolves, ethical concerns arise regarding image manipulation, privacy, and copyright.
- The ability to alter images raises questions about authenticity and the potential for misleading representations.
- Privacy issues also emerge, especially with the unauthorized use of photos captured in public spaces.
- Additionally, copyright laws must adapt to the digital landscape, ensuring that photographers' rights are respected while fostering creativity and innovation within the industry.
